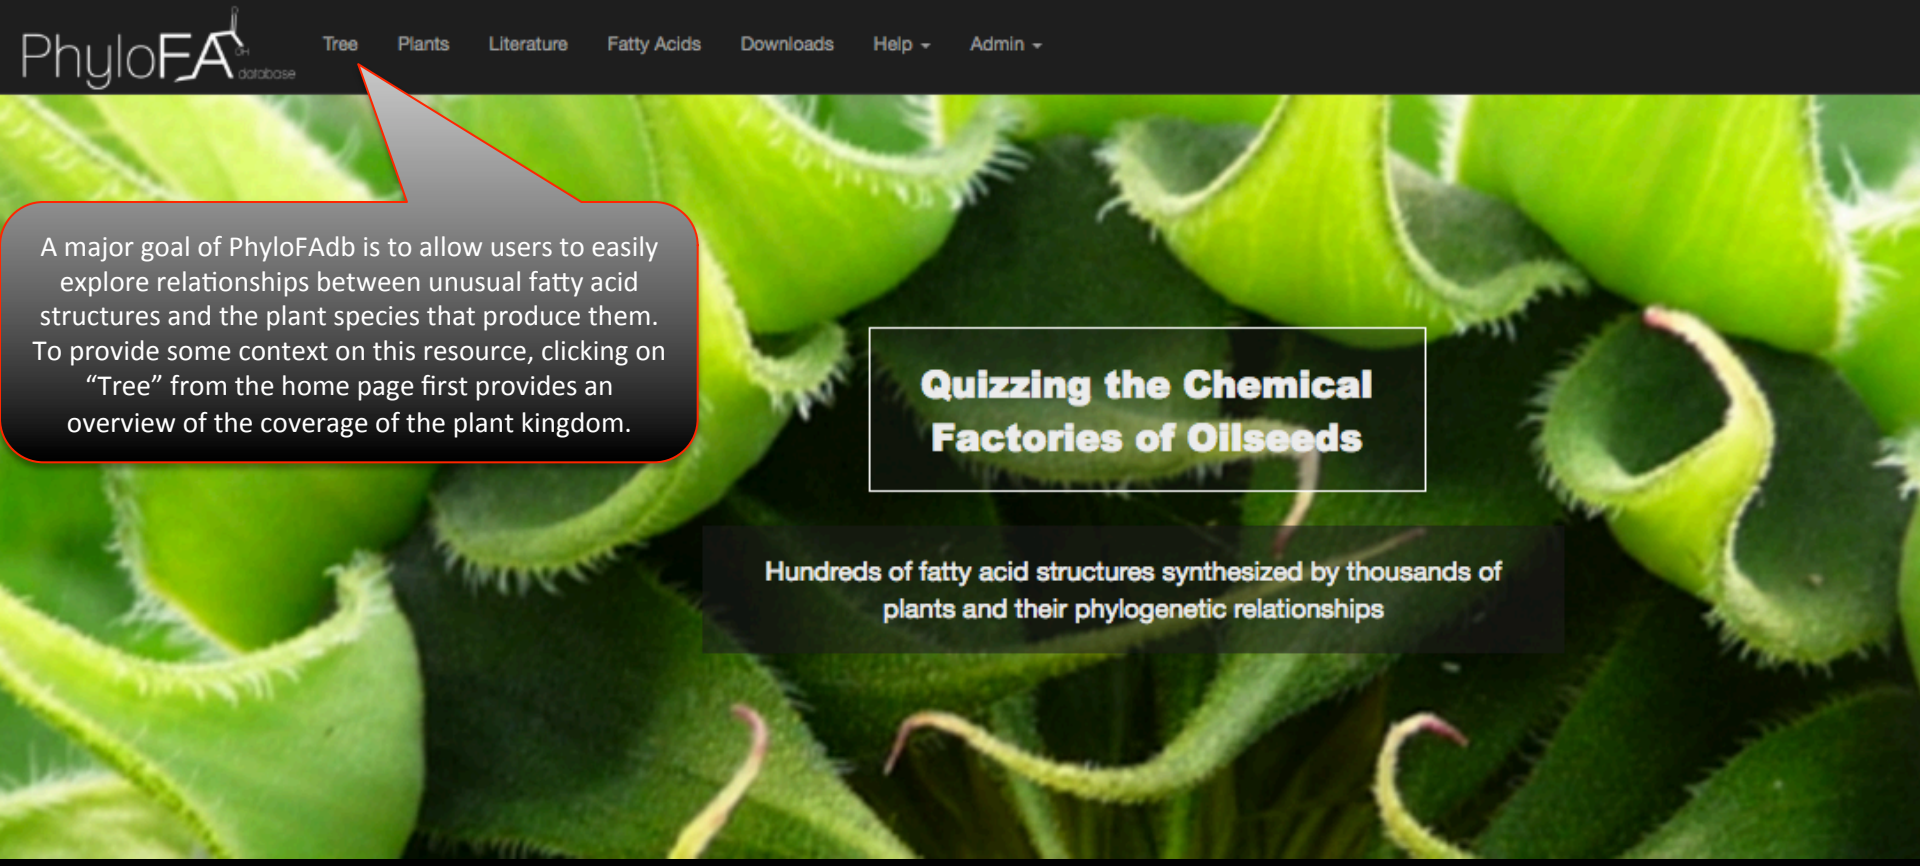
This website and database are under development.
It is based on the superb SOFA database (sofa.mri.bund.de).

Note: *PhyloFAdb does not include data from SOFA for tocopherols, sterols, and triacylglycerol structures. Links to the original SOFA website tables are provided in PhyloFAdb for each publication. It is likely that some mistakes have been made during incorporation of SOFA information into PhyloFAdb. Please notify John Ohlrogge if you find these.*



Fatty Acids

Structure images and info for >330 Fa. Click Name to see species that produce a FA, publications, and data. Click 'Tree' to display phylogentic distribution of a FA

List FA

Phylogeny

Explore relationships between unusual FA structures and plants that produce them. Clicking "Tree" at top of any page shows overview of all PhyloFAdb data coverage of the plant kingdom.

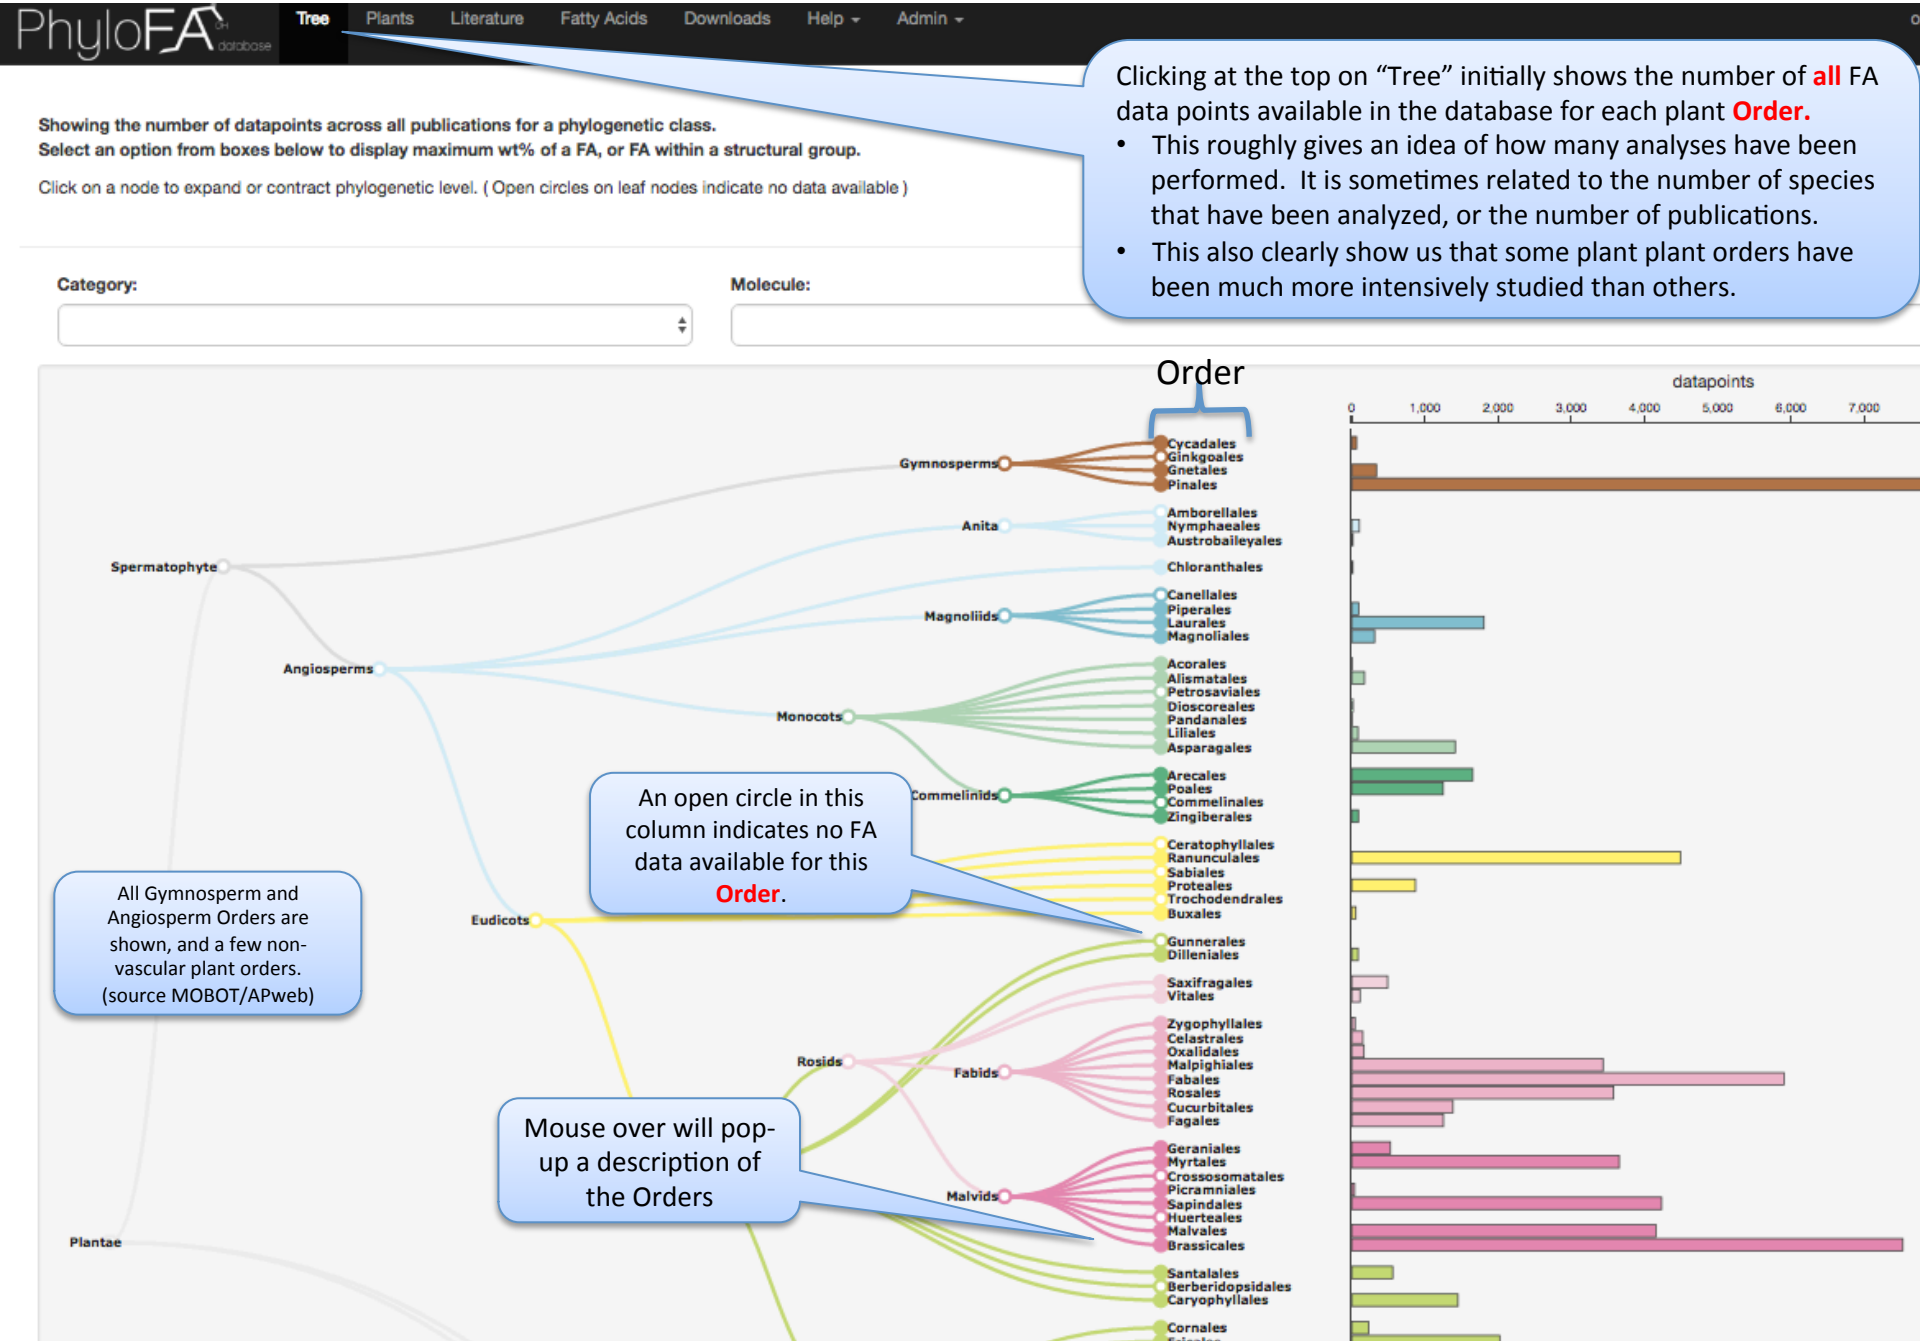
View Tree

Plants

FA analysis for > 7000 plants. Click on species for graphs of FA composition, oil content, and links to publications and individual data sets.

List Plants

A brief intro to PhyloFAdb-SOFA



Clicking at the top on "Tree" initially shows the number of **all** FA data points available in the database for each plant **Order.**

- This roughly gives an idea of how many analyses have been performed. It is sometimes related to the number of species that have been analyzed, or the number of publications.
- This also clearly show us that some plant plant orders have been much more intensively studied than others.

All Gymnosperm and Angiosperm Orders are shown, and a few non-vascular plant orders. (source MOBOT/APweb)

An open circle in this column indicates no FA data available for this **Order**.

Mouse over will pop-up a description of the Orders

Fatty Acids

Structures drawn at OPSIN (opsin.c

The "**Fatty Acids**" main page provides a list of FA structures in the database. Initially it is sorted by MW and only FA with data points in the database are shown.

Searching is currently based on case insensitive exact matching to any part of text. Simple query will search info in any of the columns of this page.
You can also select a list of hydroxy fatty acids by searching with term 'hydroxy'. To select a list of cyclo fatty acids, search with term 'cyc'. Other general terms are: epoxy, yne, octadece, cpa, cpe, C22, etc.
Advanced query is under development and is not as sophisticated as SOFA.

Publication	Plant	Sofa Table	Value	Unit
Graham, S. A.; Kleiman, R. (1992). Industrial Crops and Products 1 31-34	Cuphea pulcherrima	TAB_000655	94.4	GLC-Area-%

Links to underlying SOFA data tables

- Two drop down boxes are available that will produce a phylogenetic tree for either a) selected individual fatty acids or b) category of fatty acid.

The drop down list for “Example molecules” shows:

Delta notation; common name; systematic name

This list provides faster access to some FA structures and illustrates features of PhyloFAdb

The drop down list for “Category” allows user to display the phylogenetic distribution of a particular functional groups (e.g. epoxy, cyclopropane, etc.)

Why are there 13 “plants” listed for *Brassica napus?*
SOFA created a separate table for every FA analysis for every plant species from every publication. If the plant species name was in any way different (spelling, variety, geographical origin, etc.) we did NOT condense these plant names.
However, as shown on the sesame page, we did condense data graphically if the SOFA text for plant name was identical.

Showing the maximum wt% across all publications for FA: 8:0; Caprylic acid; Octanoic acid

Click on a node to expand or contract phylogenetic level. (Open circles on leaf nodes indicate no data a

Here we can see which plant orders have been reported to produce 8:0 and the maximum wt% reported for each order.

- Clicking on the Myrtales Node expands to Family and species.
- Clicking on the Bar in the graph provides species and publications.

Category:

Molecule: 8:0; Caprylic acid; Octanoic acid

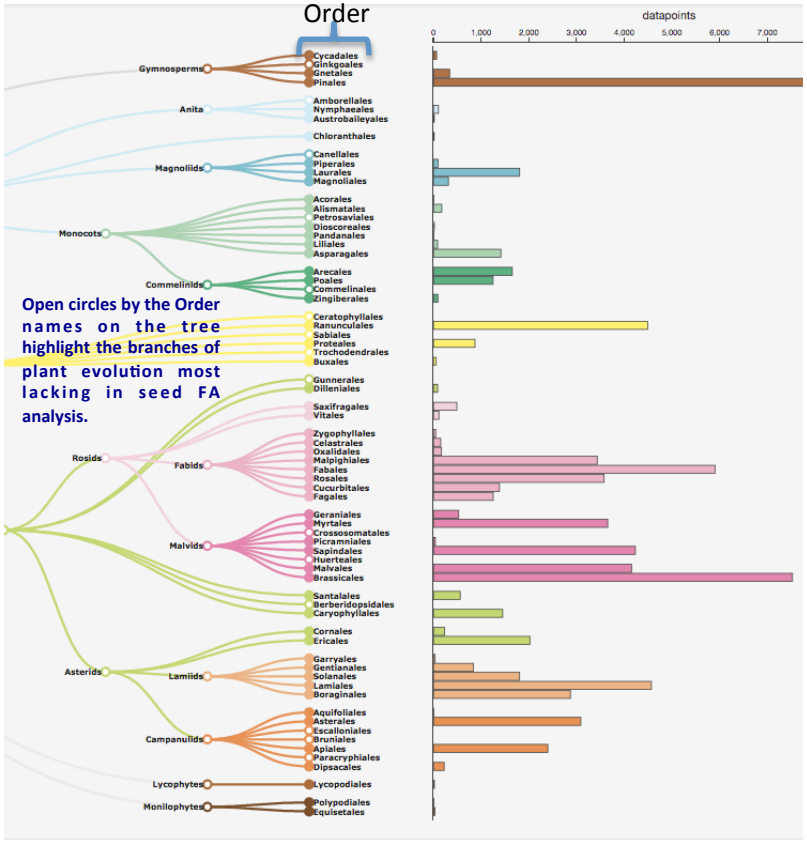
How much of the plant kingdom has been surveyed? What branches in plant evolution are missing FA data and can we discover new plant FA structures in these branches?

Analysis of seeds of thousands of plant species has revealed the occurrence of hundreds of different fatty acid structures. Are there more unique fatty acid structures still to be discovered? Examination of all the plant species represented in PhyloFAdb-SOFA, together with recent phylogenetic information allows us to identify branches in plant evolution whose seeds may not have been analyzed for fatty acid composition.

Approximately 25% of plant orders and 50% of plant families have not been analyzed for FA composition. Therefore, many new fatty acid structures remain to be discovered.



A Resource for Discovery of New Fatty Acid Structures: Plant Orders without Data in PhyloFAdb

Order	Description
Amborellales	Amborella trichopoda is only species. Molecular phylogenetics places the genus at the base of the flowering plant lineage
Berberidopsidales	Southern Hemisphere woody flowering plants.
Bruniales	Includes heath-like shrubs of S. Africa; trees and shrubs native to Andes of S. America
Canellales	Members of the magnoliids. 136 species of fragrant trees and shrubs
Ceratophyllales	Hornwort flowering plants
Commelinales	Spiderwort and pickerelweed; mostly tropical and subtropical herbs
Crossosomatales	Rockflower order; woody shrubs or trees of the northern temperate regions
Escalloniales	Member of Asterids clade
Gingkoales	Only one species; Gingko biloba
Gunnerales	Contains two genera: *Gunnera* (in family Gunneraceae) and *Myrothamnus* (in family Myrothamnaceae)
Huerteales	Shrubs or small trees found in most tropical or warm temperate regions. all five of the genera are poorly known
Metteniusales	Trees, shrubs, and lianas, primarily of the tropics.
Paracryphiales	Woody shrubs and trees native to Australia, southeast Asia, and New Caledonia.
Petrosaviales	Rare leafless achlorophyllous, plants found in dark rainforests in Japan, Asia and Borneo
Sabiales	Incl. single family (Sabiaceae), considered by some as member of Proteales.
Trochodendrales	Includes wheel tree; two extant genera, of south east Asia.
Vahliales	Herbs and subshrubs that grow in Africa and the Indian subcontinent.

Many other features of the website and database are not described here, but can be discovered by clicking on links.

Future: Information will be added on genes, enzymes and pathways for synthesis of unusual fatty acids, and which pathways are still unknown.
Literature will be surveyed to add data from newer publications.
